

Tetraploid Annual Ryegrass

MACH 1

Mach 1 is a fast establishing, high yielding tetraploid with excellent winter production for intensive grazing. Mach 1 keeps growing late into the season and holds its late season quality better than Tetila types and early maturing annuals. Mach 1 is consistently performing well in local trials and is very compatible with annual clovers to improve hay and silage quality.

Key Points: Fast establishment; Superior winter growth; excellent recovery from grazing; Ideal for hay and silage.

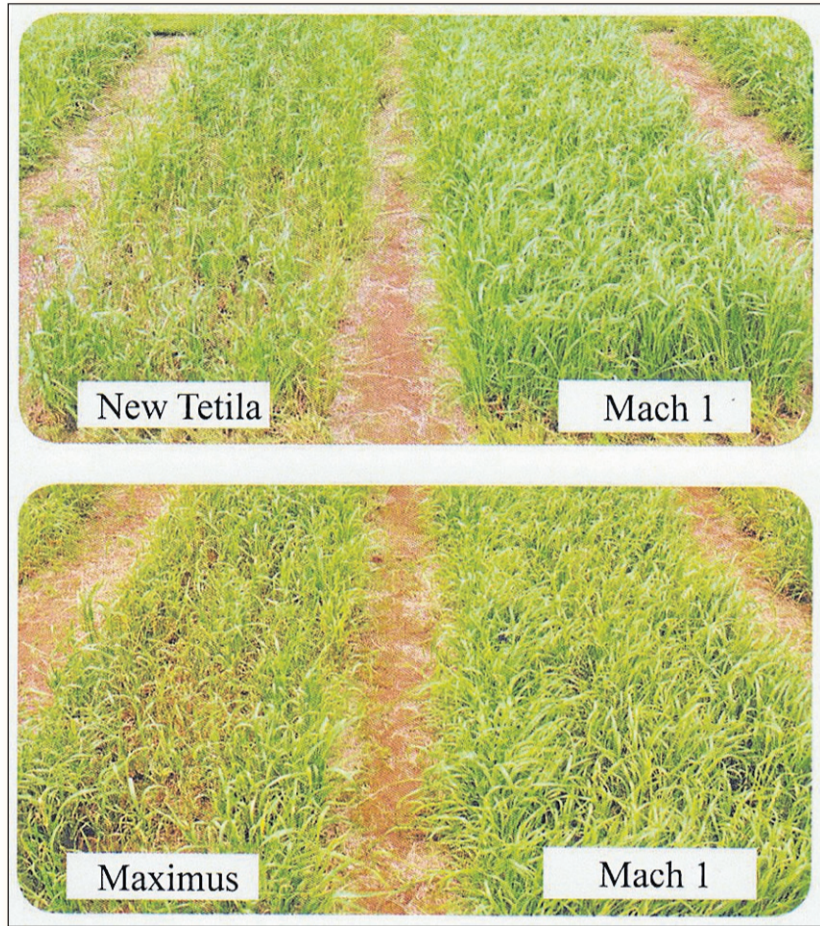

Mach 1 has high feed quality and is mid flowering so maintains quality well into spring and early summer. Mach 1 has excellent recovery from grazing and is ideal for silage and hay produc-

tion. Mach 1 is a tetraploid annual ryegrass and is a suitable replacement for varieties such as Tetila.

Sowing hints: Drill seeds into a well prepared seed bed. Roll paddock to get good seed to soil contact. Sow Kickstart® treated seed with a DAP or MAP type fertilizer at approximately 100kg/ha to achieve an even, fast emergence for early grazings. Use slug bait if slugs are present.

Rotational grazing maximizes growth rates. Strategic nitrogen application or hay booster type fertilisers are recommended for extra dry matter production for grazing, silage or hay production.

For more information see the AusWest Seed reps at Trade Day in Braidwood on the 23rd May.

• Mach 1 tetraploid annual ryegrass holds its quality later into the season than short season types. Photos above taken on 29/12/11 demonstrate the higher drymatter production of Mach 1 compared with other available annuals.

Granulated Lime for rapid pH adjustment

There are a lot of advantages in using granulated lime.

Calcipril & Magpril can be applied using a standard fertiliser spreader at a time convenient for the farmer. This eliminates the use of outside contractors and makes spreading less dependent on prevailing weather conditions.

Calcipril is made from a micronized powder which is granulated to make it easy to apply to the crop without producing clouds of dust.

Immediate pH improvement is achieved by a fast response from the crop which allows maximum utilization of expensive fertiliser.

Calcipril can also be used to spot treat problem areas.

An excellent source of calcium, Calcipril is

an essential nutrient important in plant cell wall structure.

Calcipril can be applied by air to steep terrain allowing utilisation of all pasture.

Omya produces two grades of granulated lime. Calcipril is a straight calcium lime ideal for areas with high levels of magnesium. Magpril is a blend of calcium and magnesium lime ideal for magne-

sium deficient areas with a pH imbalance.

Correction applications are calculated according to soil type. This would normally be in the range of 150 – 300 kg per acre. For maintenance applications 2kg of granular lime per kg of ammonium nitrate used.

For advice speak to the OMYA representative at Trade Day in Braidwood on 23rd May.
