Medical Marijuana, A Cure for Cancer?

Robert Melamede, Ph.D. / Biology Dept. UCCS, Cannabis Science, Inc.

ABSTRACT

Every vertebrate, from the time of conception till the time of death, literally has all body systems homeostatically regulated by endocannabinoids (marijuana-like compounds produced by the body). Illnesses are biochemical imbalances, failures of homeostasis. By being alive, all organisms suffer from the common biochemical imbalances that underlie aging and all age-related illness, including autoimmune, cognitive, cardiovascular diseases, as well as cancers.

Over 600 peer reviewed articles show that numerous cancer types (lung, breast, prostate, glioma, thyroid, leukemia, basal cell carcinoma, melanoma, etc.) are killed by cannabinoids in tissue culture and animal studies. Furthermore, cannabinoids inhibit the biochemical pathways involved in metastasis and drug resistance. The question that naturally arises is "Why is a plant that inhibits aging, kills cancers, and whose activity is found in mother's milk illegal?"

Because the federal and state governments have failed to implement marijuana policies that are reflective of modern scientific knowledge and thousands of years of medical history, the people have demanded, and gained access to this miraculous medicine through direct vote with the initiative process. In effect, marijuana clinical efforts are now in the hands of the people and the medical marijuana community. This document provides dramatic photographic evidence of cannabis extracts curing basal-cell carcinoma via it's topical application.

HISTORY

This Australian woman grew up in Queensland where the population suffers from the highest rate of skin cancer in the world. Basal cell carcinoma is the most common form of cancer with over 800,000 cases occurring each year in the US.

She had a number of surgeries to remove previous lesions including a basal cell carcinoma. After a new lesion appeared on her right cheek, alternative therapies that included the topical application of cannabis extracts were tried.

Cannabis extracts were applied daily until her surgeon stated that there was no need for surgery since the lesion on her cheek was gone. However, a new lesion had appeared on her right nostril.

The series of photos below document the disappearance of the lesion on the nostril after ten days of self-administering topical cannabis extracts.

[REDACTED]

Dear Adriene,

Re: [REDACTED]

D.O.B: [REDACTED]

I saw [REDACTED] again last week and undertook some biopsies.

As you know we have been keeping an eye on her right cheek for a couple of years. She treated the biopsy proven BCC with a tar extract which seemed to get rid of the BCC from a clinical point of view. A persistent red spot in the middle of the area was biopsied last week, the result of which showed benign fibrous papule only. There was certainly no evidence of BCC. I reassured [REDACTED] of this result over the phone today.

Over the last couple of months [REDACTED] has noticed a scaly area on the right alar. To exclude BCC we also took a shave biopsy of this last week. The pathology result was simply solar keratosis.

At this stage I have not arranged to see [REDACTED] again routinely but I would be happy to see her at anytime if necessary.

[REDACTED] knows to report any suspicious changes that occur. Thank you again for referring her.

Yours sincerely,

[REDACTED]
